PROFESSIONAL SUMMARY

AI governance architect and cybersecurity engineer focused on deterministic, governed autonomous systems. Hands-on experience in incident response, digital forensics, vulnerability management, and network analysis, translated into documented, repeatable, and auditable outcomes. Bridges business stakeholders and technical teams. Creator of RogueOS, a deterministic autonomous agent governance framework filed under two USPTO provisional patent applications. Open to AI governance, solutions architecture, cybersecurity, SOC, and VMDR roles.

CORE SKILLS

Governance and Autonomous Systems: Deterministic execution, policy enforcement, permission lattices, human-in-the-loop controls, AI risk and model governance.

Cybersecurity and Forensics: Incident response, digital forensics to NIST SP 800-86, evidence preservation, chain of custody, threat hunting, MITRE ATT&CK, SOC operations, log and packet analysis.

Vulnerability and Systems: Qualys VMDR, attack surface analysis, system hardening, change management, network security.

Tooling: Python, PowerShell, Wireshark, NetworkMiner, Process Hacker, System Informer, Volatility, Autopsy, FTK Imager, TCPView, Nmap, Burp Suite, Splunk, Microsoft Sentinel, CrowdStrike, Microsoft Defender for Endpoint, AWS, Azure.

Business: Requirements gathering, technical communication, stakeholder management, implementation planning, executive-facing risk translation.

EXPERIENCE

Founder and Chief Architect

May 2025 to Present

Rogue Management Group LLC, Charlotte, NC

- Designed and deployed RogueOS, a deterministic, local-first autonomous agent framework for governed AI deployment. Patent pending, USPTO provisional applications 63/828,137 and 63/864,057.
- Built Builder's Permit, a deterministic authorization model. No execution without defined authority, scope, attribution, and auditability.
- Conducts live incident response and digital forensics on Windows endpoints: packet analysis, SHA-256 verified disk imaging, evidence preservation, and chain of custody aligned to NIST SP 800-86.
- Runs vulnerability management with Qualys VMDR across endpoints and network services, from identification through remediation and verification.
- Delivers AI readiness and governance assessments that translate systems architecture into executive-facing risk decisions.

Fleet Service Agent

January 2025 to June 2026

American Airlines, Charlotte, NC

- Operated in time-critical ground operations under strict safety and authorization protocols.
- Reinforced checklists, authorization boundaries, and escalation discipline, principles applied directly to security operations and autonomous system governance.

Independent Cybersecurity and AI Development

2024 to 2025

Independent Practice, Charlotte, NC

- Completed hands-on cybersecurity training and began contract work in 2024, applying pentesting tooling including Kali Linux and command-line workflows to live technical problems.
- Transitioned into AI-assisted development, directing and validating model-generated code and translating business requirements into engineering-ready specifications.
- Work formalized as Rogue Management Group LLC in May 2025.

PROJECTS

RogueOS, Governed Autonomous System. Deterministic, local-first automation for secure execution and traceable outcomes. Policy controls, replayable state, and documentation for auditability.

Cybersecurity Incident Response and Forensics. Investigated unauthorized activity on Windows systems, captured forensic artifacts, imaged affected systems, preserved metadata, and documented findings with chain of custody discipline.

TRAINING AND CERTIFICATIONS

- CompTIA Security+ (in progress).
- Qualys VMDR (in progress).
- AWS Cloud Foundations (in progress).
- HackingLoops and InfoSec cybersecurity training (completed). Featured in a recorded testimonial for the training program.
- Self-directed cybersecurity study, seminars, and workshops since 2022.
