AI GOVERNANCE ARCHITECT | DETERMINISTIC AUTONOMOUS SYSTEMS | CYBERSECURITY | FULL-STACK SYSTEMS DEVELOPER AND SOLUTIONS ARCHITECT

PROFESSIONAL SUMMARY

AI governance architect and cybersecurity engineer who designed and built the first deterministic, locally executing governance WAL and FRE layers baked into the autonomous system. Creator of RogueOS and the Builder's Permit locally autonomous agent, with governance framework, both documented as original work and filed under USPTO provisional patent applications. I approach autonomous systems from the angle most of the field skips: authority, accountability, and execution control established before automation is ever allowed to act. Four years across systems engineering, vulnerability management, incident response, and digital forensics in production environments training, with a track record of turning hands-on security work into enforceable system design. Fluent at translating complex architecture into decisions that executives and non-technical stakeholders can act on without technical dependency.

CORE COMPETENCIES

Governance and Autonomous Systems: Deterministic Execution, Policy Enforcement, Permission Lattices, Human-in-the-Loop Controls, Replayable State Tracking, Auditability, Traceability, Agentic System Design, AI Governance, AI Risk Management, Model Governance, Controls Design, Enterprise System Integration & API Orchestration, Retrieval-Augmented Generation (RAG) & Vector Data Architecture, Fine-Tuning, Model Optimization & Local Deployment, LLMOps, Observability & Cost Optimization. Observability tools (LangSmith, Phoenix, Arize, Datadog), semantic cache layers (Redis, GPTCache), and automated eval frameworks for measuring model drift and response quality.

Cybersecurity and Forensics: Incident Response, Digital Forensics, Evidence Preservation, Chain of Custody, Threat Hunting, Attribution Analysis, Endpoint Investigation, MITRE ATT&CK, NIST SP 800-86, SIEM, SOC Operations

Vulnerability Management and Compliance: Qualys VMDR, Vulnerability Remediation, Impact Analysis, Patching, Configuration Management, Security Baselines, Audit Readiness, Compliance Reporting, NIST Alignment, Risk Scoring

Network and Infrastructure: Routing and Switching, TCP/IP, VLANs, Production Network Support, Packet and Log Analysis, Wireshark, NetworkMiner, TCPView, Cloud and Hybrid Infrastructure (AWS, Azure)

Tooling: Splunk, Microsoft Sentinel, CrowdStrike, Microsoft Defender for Endpoint, Process Hacker, System Informer, Volatility, Autopsy, FTK, Burp Suite, Nmap

Automation and Delivery: Python, PowerShell, Workflow Orchestration, Deterministic Automation, Change Management, Security Documentation, Requirements Gathering, Executive Communication, Cross-Functional Collaboration

PROFESSIONAL EXPERIENCE

Rogue Management Group LLC - Charlotte, NC
Founder and Chief Architect | 2025 to Present

- Designed and built RogueOS, a deterministic, local-first autonomous system that enforces authority, scope, attribution, and auditability before any action executes, and authored the RogueOS white paper (v1.0) defining the framework's write-ahead log, permission lattice, and zero-nondeterminism execution model.
- Created the Builder's Permit governance framework, a deterministic authorization model that treats autonomous systems the way regulated physical infrastructure is treated: no execution without defined authority, scope, attribution, and a reproducible record.
- Filed two USPTO provisional patent applications covering the architecture and governance model (63/828,137 and 63/864,057).
- Conducted live incident response and forensic investigation across Windows endpoints and network traffic using Wireshark, NetworkMiner, TCPView, Process Hacker, and cryptographic hashing workflows; identified and contained unauthorized activity on production systems while preserving evidence and maintaining chain-of-custody documentation.
- Performed impact analysis and executed remediation through configuration changes, service hardening, and endpoint isolation while maintaining system stability.
- Translated complex systems architecture into executive-facing risk assessments, AI readiness evaluations, and governance frameworks that decision-makers could act on directly.

American Airlines - Charlotte, NC
Fleet Service Agent | 2025 to 2026

- Operated in a high-volume, safety-critical environment governed by strict checklists, authorization boundaries, and escalation protocols, the same disciplines applied directly to incident response and autonomous system governance.
- Coordinated time-critical ground operations and cross-team communication under pressure, reinforcing situational awareness, accountability, and precise execution.

Technical Consulting and Enterprise Contracting - Charlotte, NC
Senior Systems Engineer and Technical Consultant | 2020 to 2024

- Delivered network and infrastructure troubleshooting, systems assessment, and technical consulting across production business environments over six years of engagements.
- Performed vulnerability assessments, threat modeling, attack-surface analysis, and root-cause investigations across applications, infrastructure, and data pipelines.
- Executed remediation including patching, configuration changes, and upgrades under time-sensitive, change-controlled conditions, then validated fixes and confirmed stability with engineering and operations stakeholders.
- Evaluated authorization boundaries and governance gaps, and produced risk documentation suitable for technical teams, business leaders, and formal review.
- Translated technical findings into clear business recommendations for decision-makers.

SELECTED WORK

- **RogueOS, Governed Autonomous System** (github.com/stephenjadendiesl): Deterministic, local-first automation with policy controls, replayable state tracking, audit logging, and documentation built for security review and courtroom-grade auditability.
- **Cybersecurity Incident Response and Forensics**: Investigated unauthorized activity on Windows systems, captured and hashed forensic artifacts, cloned affected systems, preserved metadata, and produced attribution and before/after documentation aligned to NIST SP 800-86 practices.
- **AI Governance and Business Enablement**: Built governed automation approaches that help organizations adopt AI safely by first mapping execution paths, decision authority, and accountability gaps before automation is applied.

INTELLECTUAL PROPERTY

- USPTO Provisional Patent Application 63/828,137, RogueOS and Builder's Permit governance model.
- USPTO Provisional Patent Application 63/864,057, autonomous system governance framework.
- Author, RogueOS: A Deterministic, Locally Executing Autonomous-Agent Framework, White Paper v1.0.

TRAINING AND CERTIFICATIONS

- CompTIA Security+ (in progress)
- Qualys VMDR, Vulnerability Management, Detection and Response (in progress)
- AWS Cloud Foundations (in progress)
- Advanced Cybersecurity and Full-Stack Architecture, 16-Month Immersive Track
- Hacking Loops and InfoSec Cybersecurity Training, hands-on training applied to live incident-response and forensic work
